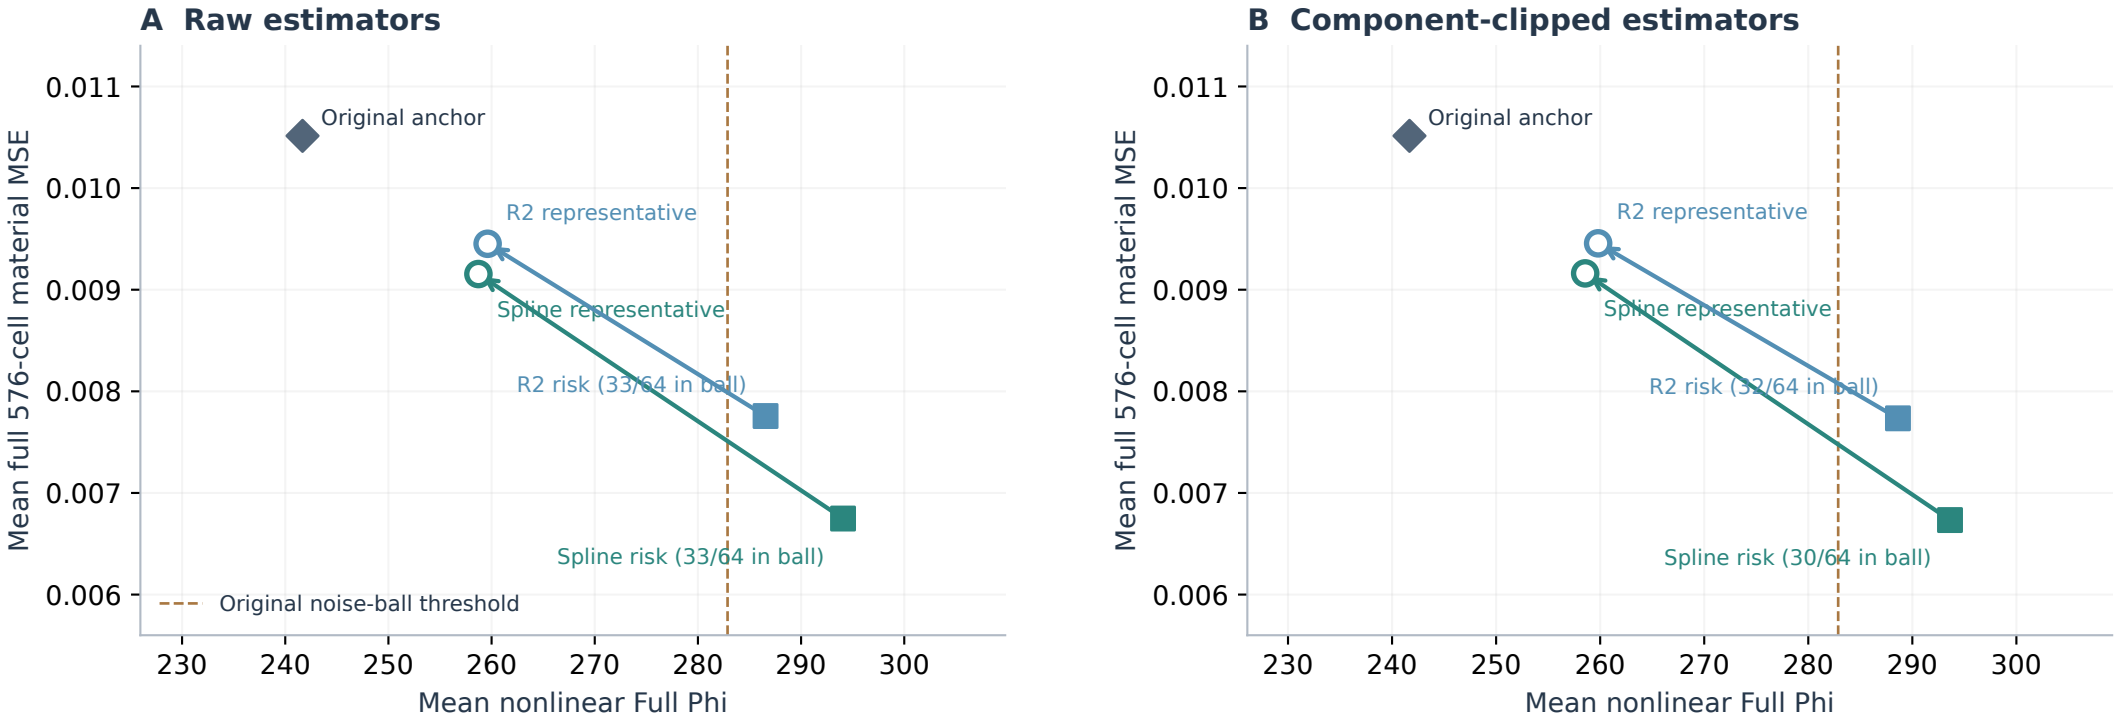
Material risk and nonlinear data fit are different quantities



Identical first 64 L1 parents; fixed Spline seed 2026102501 and frozen R2. Squares: material risk actions; circles: original bounded representatives.

Arrows link fixed outputs, not an optimization trajectory. Raw/clipped Full evaluation does not prove decoder realizability; representatives are not posterior means.

All 320 original SLSQP cases stopped at budget. Callback-only selection limitation is preserved; independent Full-J controls are shown separately.
