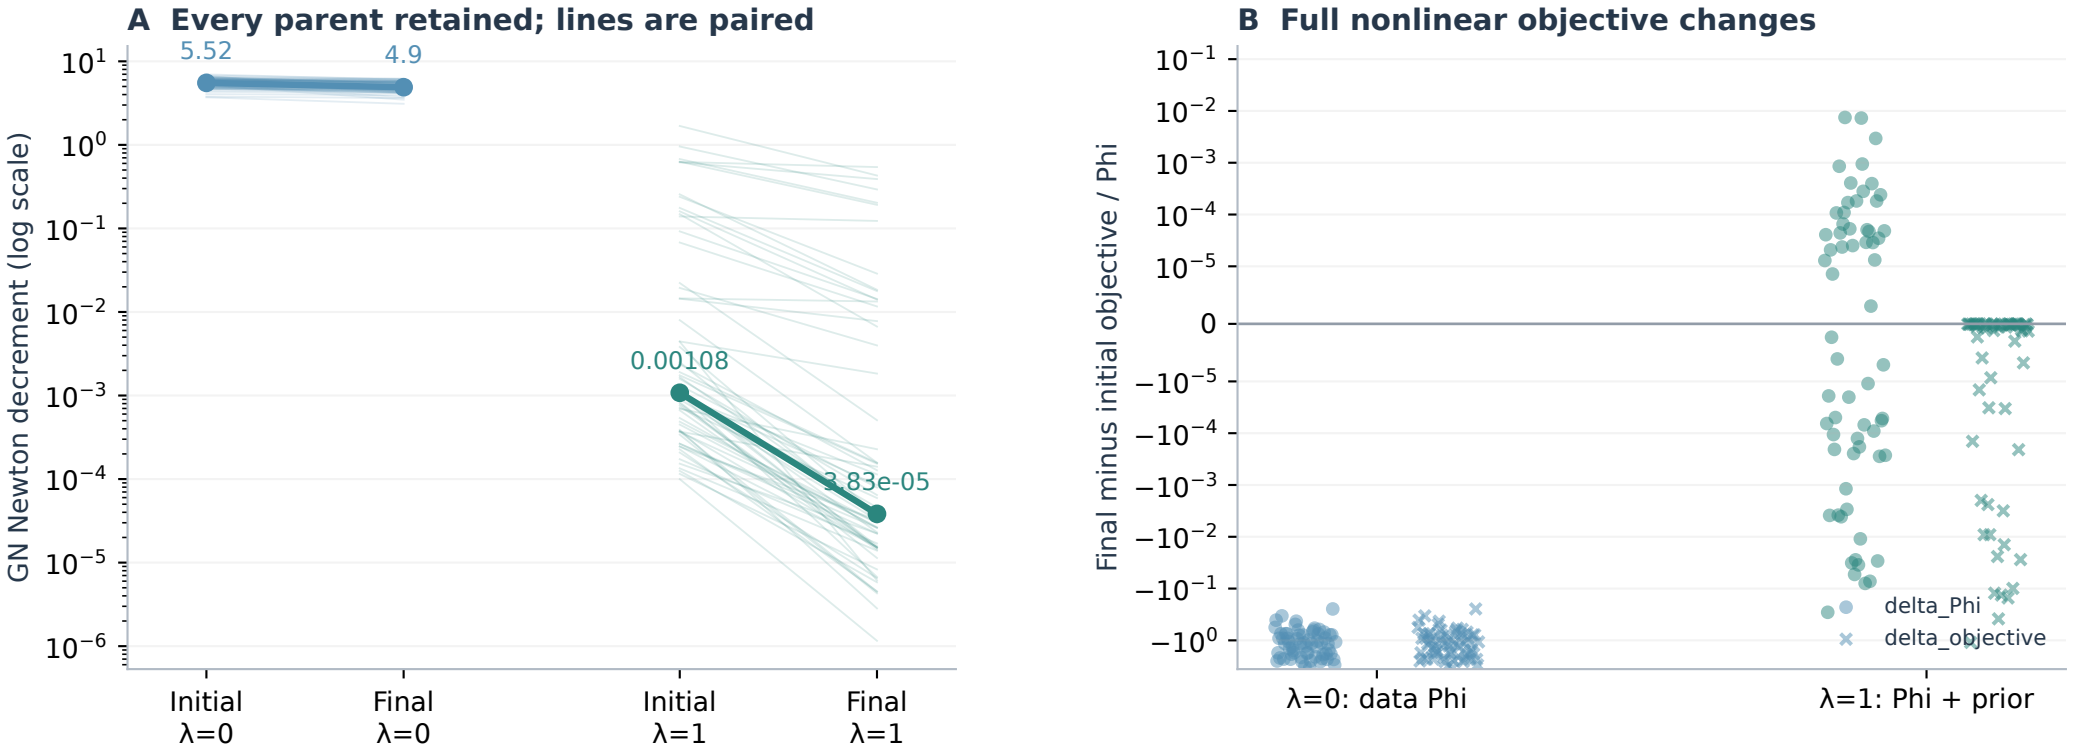
Exact Full-J controls: objective progress and GN stationarity differ



64 paired L1 parents; post-method-freeze, pre-GT exploratory addendum. Exact Full-J gradient with GN curvature, not the full nonlinear Hessian.

All 128 arms stopped at the same 16-state / 256-RHS local cap. Total new 30,752 RHS = Full 9,184 + accepted-update J 21,568; cached initial J disclosed.

Small median decrement is not universal or global convergence: λ=1 final maximum = .542; exact gradient maximum = 2.548. No MMSE/posterior certificate.
