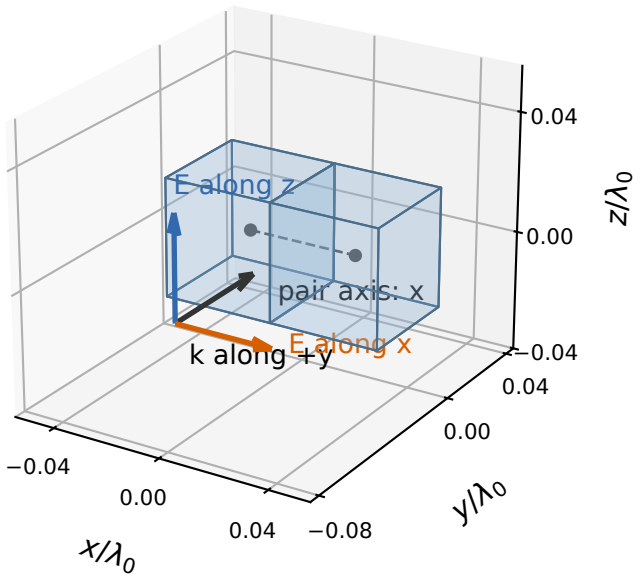
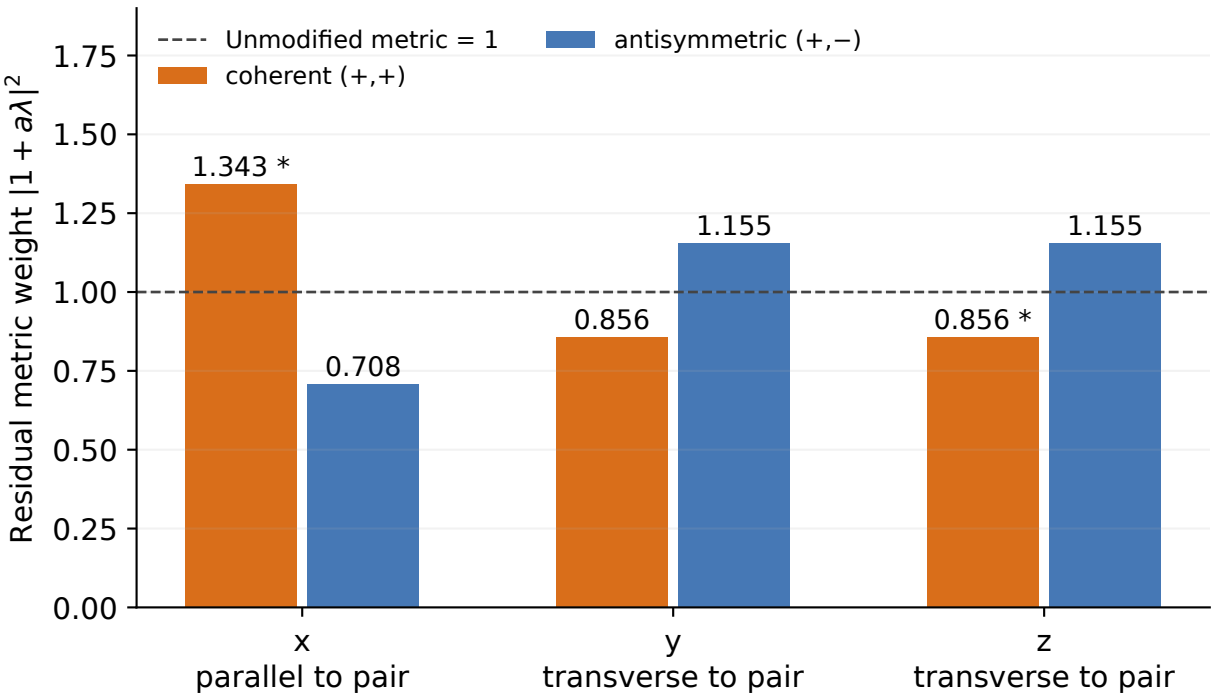
Vector DDA two-cell residual metric; not imaging

Saved full-vector DDA: one 6×6 solve / two RHS; plot uses saved arrays

Two known isotropic cells in 3D
$h = 0.04\lambda_0$, $\varepsilon_r = 3$, $\mu_r = 1$



Six fixed vector modes at $\beta = 0.2$
Coherent x enhanced; coherent y/z attenuated



"Longitudinal x" means parallel to the cell-pair axis, not parallel to k. Both incident E vectors are transverse to k.

* Excited by the two saved plane waves: coherent x and z only. The y and antisymmetric bars are metric modes, not extra illuminations.

No inverse recovery, 3D imaging, continuum-PDE qualification or convergence claim.
